Purpose

In recent years, the United States Army has undergone major changes in its selection of personnel. The Modern Volunteer Army Concept has been successful in providing the manpower needed to field an Army but numerous questions have been asked about the population characteristics of the United States Army as of 30 November 1974. Data is also provided for demographic indicators from the 1972 and 1973 Army Personnel Composites. Individuals who desire a more detailed report on 1972 and 1973 data should consult DAPC-PMP Report No. 29-73-E, Army Personnel Composite as of 30 November 1972 and DAPC-PMP Report No. 4-74-S Army Personnel Composite as of 30 November 1973.

Method

The Army Sample Survey is a multipurpose instrument administered worldwide on a quarterly basis. The major portion of the data in this report was collected as part of the 30 November 1974 Army Sample Survey. Statistics from any other sources besides the 30 November 1974 Army Sample Survey are noted on the particular tables.

Sample Population

The sample population for the November 1974 survey consisted of a randomly selected group of officer and enlisted personnel, both male and female. Data from the November 1972 survey was obtained from a random sample of male officer and enlisted personnel while data from the November 1973 survey was obtained from separate random samples of male personnel and female personnel. Five percent of the enlisted personnel and ten percent of the officer personnel were chosen using the terminal digits of their social security numbers.

Reliability

This report has a reliability of 95% + 5%. This means that it is reasonably sure (95% confidence level) that if a large number of samples were drawn from the same population, 95% of the ranges (confidence intervals) would include the population value.
